It allows users to create, edit, and retrieve data from databases, making it a powerful tool in various fields such as web development and data analysis.

INTRODUCTION

STRUCTURED QUERY LANGUAGE

•It is a programming language used for managing and manipulating relational databases.

A DECLARATIVE LANGUAGE

It focuses on specifying what data should be retrieved or modified, rather than how it should be done.

WIDELY USED IN DBMS

It allows users to interact with databases to perform tasks such as querying data, inserting or updating records, and creating or modifying database structures.

SQL is a special-purpose programming language designed for managing data in a relational database management system (RDBMS).

It focuses on specifying what data should be retrieved or modified, rather than how it should be done.

Widely used in DBMS as a data definition and manipulation language

It allows users to insert, update, delete, and retrieve data from databases. and

It enables the creation, modification, and deletion of database objects such as tables, views, and indexes.

INSTALLATION ON WINDOWS

DOWNLOAD MYSQL INSTALLER

Go to the MySQL official website: MySQL Downloads.

RUN MYSQL INSTALLER

Once the installer is downloaded, run the executable file (.exe) to start the MySQL Installer.

MYSQL INSTALLER SETUP

Select "Developer Default" for a typical installation that includes MySQL Server, MySQL Workbench, and other tools.

COMPLETE THE INSTALLATION

Follow the on-screen instructions to complete the installation.

Here are the steps to install MySQL on Windows:

1. **Download MySQL Installer:**

- Go to the MySQL official website: [MySQL Downloads](https://dev.mysql.com/downloads/).
- Under the "MySQL Installer for Windows" section, download the MySQL Installer for Windows.

2. **Run MySQL Installer:**

- Once the installer is downloaded, run the executable file (`.exe`) to start the MySQL Installer.

3. **MySQL Installer Setup:**

- The MySQL Installer provides a graphical interface for installing MySQL products. Choose the setup type based on your requirements. You can select "Developer Default" for a typical installation that includes MySQL Server, MySQL Workbench, and other tools.

4. **Complete the Installation:**

- Follow the on-screen instructions to complete the installation. You will be prompted to configure MySQL Server, set a root password, and choose other configuration options.

After completing these steps, MySQL should be installed on your Windows system. You can then use MySQL Workbench or other MySQL clients to connect to the server and manage your databases.

SQL INSTALLATION IN DETAIL

Step	Instructions
Step 1	Download the MySQL Community Server from the official MySQL website (https://dev.mysql.com/downloads/mysql/).
Step 2	Open the downloaded DMG file and double-click on the MySQL installer package to start the installation process.
Step 3	Follow the on-screen instructions to complete the installation. You may be prompted to enter your system password.
Step 4	Once the installation is complete, open the Terminal application.
Step 5	Enter the following command in the Terminal to start the MySQL server: <code>sudo /usr/local/mysql/support-files/mysql.server start</code>
Step 6	You may be prompted to enter your system password again. Enter it and press Enter.
Step 7	To verify that the MySQL server is running, enter the following command in the Terminal: <code>/usr/local/mysql/support-files/mysql.server status</code>
Step 8	You should see a message indicating that the MySQL server is running. You can now start using MySQL on your MAC.

These are the detailed steps of SQL installation of Server, workbench and shell. We can follow them for completing the installation. After installation we can move on to the database creation.

CREATING THE DATABASE

1. Database Design

2. Accessing MySQL

3. Creating a New Database

4. Switching to the Database

5. Creating Tables

6. Inserting Data

7. Checking the Database Structure

```
CREATE DATABASE CourseDatabase;
```

```
USE CourseDatabase;
```

```
CREATE TABLE Students (  
  student_id INT PRIMARY KEY,  
  first_name VARCHAR(50),  
  last_name VARCHAR(50),  
  enrollment_date DATE  
);
```

```
INSERT INTO Students (student_id, first_name, last_name, enrollment_date)  
VALUES (1, 'John', 'Doe', '2022-01-01');
```

```
DESCRIBE Students;
```

Steps to Create a Database:

1.Database Design:

1. Before creating a database, it's crucial to design it. Consider the entities, relationships, and attributes relevant to the subject matter of the course.
2. For example, if the course is related to a university, entities might include students, courses, and professors.

2.Accessing MySQL:

1. On your MySQL server, either locally or remotely, access the MySQL command-line interface or a graphical interface like MySQL Workbench.

3.Creating a New Database:

1. Use the CREATE DATABASE statement to create a new database. For instance: `CREATE DATABASE CourseDatabase;`

4.Switching to the Database:

1. After creating the database, switch to it using the USE statement: `USE CourseDatabase;`

5.Creating Tables:

1. Design tables based on the entities identified earlier. Specify the columns, data types, and any constraints.
2. Example for creating a Students table:sqlCopy code

3. `CREATE TABLE Students (student_id INT PRIMARY KEY, first_name VARCHAR(50), last_name VARCHAR(50), enrollment_date DATE);`

1.Inserting Data:

1. Populate the tables with sample data to work with during the course.
2. Example for inserting a student record: `INSERT INTO Students (student_id, first_name, last_name, enrollment_date) VALUES (1, 'John', 'Doe', '2022-01-01');`

2.Checking the Database Structure:

1. Use commands like DESCRIBE or SHOW COLUMNS to inspect the structure of tables.
2. Example: `DESCRIBE Students;`

A database most often contains one or more tables. Each table is identified by a name , and contain records (rows) with data.

SQL keywords are NOT case sensitive

Some database systems require a semicolon at the end of each SQL statement.

Data Retrieval with SQL

Querying Data from Tables

SELECT	FROM	WHERE
		
Used to retrieve data from one or more tables based on specified criteria.	Specifies the table(s) from which to retrieve data.	Specifies the conditions that the retrieved data must meet.

- Mastering SELECT, FROM, and WHERE is foundational for effective data retrieval in SQL.
- These commands provide the flexibility to extract the specific information needed from large datasets.

SELECT STATEMENT

- The SELECT statement is used to select data from a database.

- Example:

Return data from the Customers table:

```
SELECT CustomerName, City FROM Customers;
```

- Syntax

```
SELECT column1, column2, ...  
FROM table_name;
```

- Select ALL columns

```
SELECT * FROM Customers;
```

- Functions

- Column Selection
- Aggregate Functions
- Grouping Data

It allows users to create, edit, and retrieve data from databases, making it a powerful tool in various fields such as web development and data analysis.

Functions:

Exploring the SELECT clause for specifying columns to be retrieved.

Understanding functions like COUNT, SUM, AVG, and MAX for data summarization.

Implementing GROUP BY clause for data grouping and aggregation.

WHERE STATEMENT

- The WHERE clause is used to filter records.
- It is used to extract only those records that fulfill a specified condition.

- **Example:**

Select all customers from Mexico:

```
SELECT * FROM Customers
WHERE Country='Mexico';
```

- **Syntax:**

```
SELECT column1, column2, ...
FROM table_name
WHERE condition;
```

- **Functions:**

- Conditional Filtering
- Combining Conditions
- Case Study: Advance Filtering using operators

The WHERE clause is an essential component of SQL queries as it allows you to filter data based on specific conditions. By using the WHERE clause, you can specify criteria that must be met for the data to be retrieved. This helps you narrow down the results and retrieve only the data that meets your specified conditions.

The syntax for using the WHERE clause in a SELECT statement is as follows:

OPERATORS IN THE WHERE CLAUSE

Operator	Description
=	Equal
>	Greater than
<	Less than
>=	Greater than or equal
<=	Less than or equal
<>	Not equal. Note: In some versions of SQL this operator may be written as !=
BETWEEN	Between a certain range
LIKE	Search for a pattern
IN	To specify multiple possible values for a column

Advanced Filtering with BETWEEN and LIKE Operators

01

Range Queries with BETWEEN

Applying the BETWEEN operator for range-based filtering.

02

Pattern Matching with LIKE

Using the LIKE operator for pattern-based data retrieval.

This helps you narrow down the results and retrieve only the data that meets your specified conditions.

The syntax for using the WHERE clause in a SELECT statement is as follows:

THE **AND**, **OR** AND **NOT** OPERATORS

The WHERE clause can contain one or many
AND, NOT and OR operators.

AND, OR, NOT OPERATORS

AND

```
SELECT *  
FROM Customers  
WHERE Country = 'Spain' AND CustomerName LIKE 'G%';
```

All Conditions must be true

SYNTAX

SELECT column1, column2, ...

FROM table_name

WHERE condition1 AND condition2 AND
condition3 ...;

1/3/2024

OR

```
SELECT *  
FROM Customers  
WHERE Country = 'Germany' OR Country = 'Spain';
```

The OR operator displays a record if any of
the conditions are TRUE.

Syntax

SELECT column1, column2, ...

FROM table_name

WHERE condition1 AND condition2 AND
condition3 ...;

1/3/2024

NOT

```
SELECT * FROM Customers  
WHERE NOT Country = 'Spain';
```

Syntax

SELECT column1, column2, ...

FROM table_name

WHERE NOT condition;

There are various ways to use the NOT
operator NOT LIKE, NOT BETWEEN, NOT

IN, NOT >, NOT <

1/3

The **AND** operator is used to filter records based on more than one condition, like if you want to return all customers from Spain that starts with the letter 'G':

The **OR** operator is used to filter records based on more than one condition, like if you want to return all customers from Germany but also those from Spain:

The **NOT** operator is used in combination with other operators to give the opposite result, also called the negative result.
